

Ad-level performance → reporting sheet

Data verification · sheet compared against the platform export · generated 2026-08-21 09:03

4 checks failed — do not make decisions from this sheet yet

14 row(s) present in the export are missing from the sheet · spend differ from the export by more than 0.5% · 409 cell(s) disagree — every one in "spend", each exactly 1000000× the export · 1 value(s) in "ad_name" do not match any known entity

422 rows in sheet 423 rows in export 3 passed 4 failed 1 advisory

WHAT DISAGREES

Key Coverage

14 row(s) present in the export are missing from the sheet

A silently dropped row is the failure mode a dashboard cannot show you: totals still look plausible because nothing is obviously broken.

Aggregate Tolerance

spend differ from the export by more than 0.5%

This is the spot-check a client performs on day one. A unit mismatch (micros versus currency) shows up here as an enormous, unmissable ratio.

metric	sheet	export	difference	%
impressions	1,602,621	1,605,998	-3,377	-0.21%
three_second_plays	467,115	467,884	-769	-0.16%
link_clicks	36,405	36,463	-58	-0.16%
purchases	2,626	2,629	-3	-0.11%
spend	27,964,720,000	28,038.9	27,964,691,961.1	99,735,338.98%
revenue	157,617.48	157,736.4	-118.92	-0.08%

Row Level Diff

409 cell(s) disagree — every one in "spend", each exactly 1000000× the export

A constant ratio across every affected cell is a missing unit conversion, not unreliable data — one line in the job file fixes all of them.

metric	cells affected	sheet ÷ export
spend	409	1,000,000× (<i>constant</i>)

Examples:

row	metric	sheet	export
2026-07-05 #193.1	spend	95,780,000	95.78
2026-07-05 #193.2	spend	46,350,000	46.35
2026-07-05 #193.3	spend	68,060,000	68.06
2026-07-06 #193.1	spend	33,600,000	33.6
2026-07-06 #193.2	spend	29,690,000	29.69
2026-07-06 #193.3	spend	144,970,000	144.97
2026-07-07 #180.1	spend	39,640,000	39.64
2026-07-07 #180.2	spend	29,320,000	29.32

and 401 more, all following the pattern above

Join Integrity

1 value(s) in "ad_name" do not match any known entity

Naming conventions are load-bearing when they are the join key. Renaming an ad in the platform silently detaches its performance from its plan.

unmatched value	first seen
#184.2 (v2 hook)	2026-08-01

WORTH KNOWING

Restatement

7 value(s) revised inside the attribution window (expected)

Late conversions inside the window are normal and are reported as such. A change to a settled day is not normal, and is the signal that something upstream changed definition.

CHECKS THAT PASSED

Unique Keys

primary key is unique across the sheet

Duplicates double-count spend. They usually arrive when a page is retried after a timeout and the write path appends instead of upserting.

Date Continuity

40 consecutive days present, 2026-07-05 to 2026-08-13

A timezone offset on the reporting day is the usual cause: rows land on the neighbouring date and one boundary day ends up short or empty.

History Preserved

no row present in the previous snapshot has been lost

Rolling-window syncs delete the past to stay small. If decisions were made on last month's numbers, last month's numbers have to remain reproducible.

HOW THIS WAS CHECKED

1. The sheet is compared against `out/platform-export.csv` — the export taken from the platform itself, which is the artefact a spot-check would use.
2. Totals are compared with a stated tolerance of **0.5%**; anything outside it is reported rather than rounded away.
3. Rows the source stopped returning are **retained**, not deleted, and every run leaves an immutable snapshot.
4. Writes are withheld unless explicitly approved, and each run appends receipts to `out/receipts.jsonl`.
5. This run read **422** row(s) across **2** page(s), and committed **422** row(s).
6. **Demonstration run.** The source was the bundled simulator with these faults switched on: `micros`, `cursor_drift`, `rate_limit`, `rename`. The data is synthetic; the checks are the same ones used against a live platform.

Generated by syncproof. The sheet is never the evidence — the export is. Anything reported here can be recomputed from the receipts and the snapshot in the same run.
